6. Database Structure	5
7. Screen Descriptions	6
8. Flowcharts	7-8
9. Feature Prioritization	9
10. Out of Scope	9

1. Technical Background

Pronto is a web platform for booking home-service professionals. The system manages an end-to-end service process: opening an issue, matching the customer with a professional, selecting an arrival time window, receiving real-time status updates, tracking the booking, and completing the service.

The system is designed for two main user types: customers and service professionals. The product includes two main service paths: Standard booking and SOS emergency booking. In the Standard booking path, the customer continues to choose directly from a list of available professionals where each professional presents their own price offer. After the customer selects a professional, both alternatives merge into the same confirmation and tracking flow. In the SOS emergency path, the system displays available urgent professionals and allows the customer to choose one before the booking request is confirmed.

2. User Classification

Customer	Open service requests; choose Standard or SOS; in SOS choose from available urgent professionals; view prices and availability; track booking status; cancel when allowed.	Book a relevant professional quickly and transparently.
Service Professional	Manage availability; receive requests; provide price offers; accept or reject booking requests; update job status.	Manage workload efficiently and receive relevant service requests.

3. Functional Requirements

3.1 Platform Requirements

- 3.1.1 The system shall operate as a responsive web platform.
- 3.1.2 The interface shall support mobile, tablet, and desktop screens.
- 3.1.3 The version 1.0 interface language shall be Hebrew.

3.2 User Identification

- 3.2.1 Users shall be able to register using email and password.
- 3.2.2 The system shall send a verification code after registration.
- 3.2.3 A service professional shall require administrator approval before receiving bookings.

3.3 Issue Creation

- 3.3.1 The customer shall select a service category.
- 3.3.2 The customer shall enter a text description of the issue.
- 3.3.3 The customer shall be able to upload images of the issue.
- 3.3.4 The system shall suggest an issue category using AI.
- 3.3.5 The customer shall be able to confirm or change the suggested category.

3.4 Standard Booking Flow

- 3.4.1 After opening a regular issue and confirming or editing the AI classification, the customer shall continue to the Standard booking path.
- 3.4.2 In the Direct Professional List option, the system shall display relevant professionals, where each professional card includes availability, rating or trust indicator, and a price offer.
- 3.4.3 The customer shall select a professional by choosing directly from the professional list.
- 3.4.6 After the customer selects a professional, it goes to the booking confirmation flow.
- 3.4.7 The selected professional shall be able to approve or reject the booking request.
- 3.4.8 If the selected professional approves, the system shall confirm the booking and display ETA and tracking information(future version) to the customer.
- 3.4.9 If the selected professional rejects the request, the system shall return the customer to the relevant professional-selection step.

3.5 SOS Booking Flow

- 3.5.1 The customer shall be able to select SOS for urgent issues after confirming or editing the AI classification.
- 3.5.2 The system shall display a list of available relevant professionals who are currently able to receive urgent requests.
- 3.5.3 The customer shall select the preferred professional from the SOS professional list.
- 3.5.4 The selected professional shall receive an urgent booking request and shall be able to approve or reject it.
- 3.5.5 If the selected professional approves, the system shall confirm the booking and display ETA and tracking information(future version) to the customer.
- 3.5.6 If the selected professional rejects the request or becomes unavailable, the system shall return the customer to the SOS professional list or display a no-available-professional message.

3.6 Statuses and Notifications

- 3.6.1 Booking statuses shall include: Pending, Confirmed, On the Way, Completed, Cancelled, and Expired.
- 3.6.2 The system shall send real-time notifications to the customer and the service professional.

4. Technical and UI/UX Requirements 4.1

UI/UX

4.1.1 The interface shall follow a mobile-first design approach. 4.1.2 Each main booking action shall require no more than five clicks. 4.1.3 The system shall display clear error messages.

4.2 Technologies

4.2.1 Frontend: React.

4.2.2 Backend: Spring Boot.

4.2.3 Database: DynamoDB.

4.2.5 Cloud infrastructure: AWS (EC2, Amplify, S3,DynamoDB,API Gateway, SQS)

4.3 AI and Integrations

4.3.1 The system shall use AI for issue classification.

4.3.2 The system shall support image upload.

4.3.3 The system shall send real-time notifications.

5. Performance and Security Requirements 5.1

Performance

- 5.1.1 Maximum screen loading time: 2 seconds.
- 5.1.2 Maximum response time for a status update: 1 second.
- 5.1.3 The system shall support 1,000 concurrent users.
- 5.1.4 Maximum image upload time: 5 seconds.

5.2 Security and Privacy

- 5.2.1 All communication shall use HTTPS/TLS 1.3.
- 5.2.2 Passwords shall be stored in encrypted form.
- 5.2.3 The system shall lock a user account after 5 failed login attempts.
- 5.2.4 The system shall support account deletion and personal data management.

6. Database Structure

Users	id, full_name, email, password_hash, role, created_at	Stores all users in the system.
Professionals	id, user_id, profession_type, service_area, approval_status, reliability_score	Stores professional-specific data.
AvailabilitySlots	id, professional_id, start_time, end_time, is_available	Stores professional availability windows.
Issues	id, customer_id, category_id, description, urgency_type, status	Stores customer issues and their classification.
IssueImages	id, issue_id, image_url, uploaded_at	Stores uploaded issue images.
Orders	id, issue_id, customer_id, professional_id, booked_start, booked_end, order_status, final_price	Stores confirmed bookings between customers and professionals.
Notifications	id, user_id, message_type, channel, delivery_status, sent_at	Stores outgoing notifications.

7. Screen Descriptions (Wireframes)

7.1 Home / New Issue Screen

Content: logo, main headline, service category entry point, issue description field, optional image upload button, and continue action.

Behavior: the customer can start the flow by selecting a category, describing the issue, and optionally uploading images.

7.2 AI Review and Service Path Selection Screen

Content: AI suggested category, supporting explanation, confirm/change actions, and service path selection area at the bottom of the same screen. The service path options are Standard and SOS.

Behavior: the customer can approve the AI suggestion or manually update the category, then choose Standard or SOS without moving to a separate path-selection screen.

7.3 Standard Path - Direct Professional List Screen

Content: list of relevant professionals, where each card includes professional details, availability, rating or trust indicator, and price offer.

Behavior: the customer chooses one professional directly and continues to booking confirmation.

7.4 SOS Available Professionals View

Content: list of available urgent professionals, where each card includes professional details, ETA, availability, rating or trust indicator, and price offer when available.

Behavior: the customer chooses the preferred professional from the urgent list. This does not require a fully separate SOS screen; it can reuse the professional-selection component with urgent filtering and emergency labels.

7.5 Booking Tracking Screen

Content: booking number, selected professional, confirmed time window, current status, timeline, ETA, and cancel button when allowed.

Behavior: the screen refreshes in real time after each status update.

7.6 Professional Dashboard Screen

Content: incoming requests, availability management, and job status update actions.

Behavior: the professional can manage availability, send price offers, and approve or reject booking requests.

8. Flowcharts

The following flowcharts reflect the updated logic: Standard booking path, and the SOS path lets the customer choose from available urgent professionals instead of assigning the first professional who approves.

8.1 Standard Booking Flow

The Standard path continues directly to the professional list and then merges into one booking flow.

8.2 SOS Emergency Flow

The SOS path displays available urgent professionals and allows the customer to choose one before confirmation.

9. Feature Prioritization

Issue creation	Must-Have	Core system action and the start of every service process.
Standard path	Must-Have	The main booking path.
Professional selection	Must-Have	The booking cannot continue until a professional is selected.
Real-time status updates	Should-Have	Reduces customer uncertainty.
SOS path with customer choice	Should-Have	Creates urgent-service differentiation while keeping customer control over provider selection.
Image upload	Should-Have	Improves diagnosis quality and matching accuracy.
Internal chat	Nice-to-Have	Future convenience feature, not critical for version 1.0.
Additional language support	Nice-to-Have	Planned for a future version.

10. Out of Scope - Not Included in Version 1.0

- 10.1 Native iOS and Android applications.
- 10.2 Offline mode support.
- 10.3 Real-time GPS tracking.
- 10.4 Internal chat between users.
- 10.5 In-platform payment processing.
- 10.6 Additional language support beyond Hebrew.
